

Recap

Recap

- Requirement stage – functional and usability (CI)
- Design– design guidelines (usability), DFD+ER, OOD+UML
- Prototype (including evaluation) – CW, HE
- Coding and code testing – black-box, white-box, integration + system testing
- Usability testing

Why

- Important topic – particularly for large projects
- Prior estimation of manpower, resources and cost preferable

+66

Project Planning

- Based on such estimations, a project manager needs to
 - Create staff organization and staffing plan
 - Plan/arrange for other resources
 - Identify risks and plan for mitigation
 - Make plan for quality assurance (QA)
 - ...

Project Size Estimation

- Lines of Code (LoC) – total number of lines of instructions (excluding comments)
 - Difficult to estimate at the beginning
 - Modular hierarchy can help – coupled with prior experience

Project Size Estimation

- Function Point (FP) metric
 - Project size related to the number of functions supported by the system (along with some other things)

COCOMO

- Stands for Constructive Cost Estimation Model
- Proposed by Boehm [1981]
- Can be used for cost, duration and effort estimation

+71

Samit Bhattacharya

COCOMO

- According to Boehm, software cost estimation should be done through three stages
 - Basic COCOMO,
 - Intermediate COCOMO
 - Complete COCOMO

Basic COCOMO

- Gives estimate with following equations
 - $\text{Effort} = a \times (\text{KLoC})^{a1} \text{ PM}$ [PM = person months, KLoC = Kilo LoC]
 - $\text{Tdev} = b \times (\text{Effort})^{b1} \text{ Months}$
- Constants: a, a1, b, b1
- Takes different values for different types of projects

Project Types & Constant Values

- **Organic:** if project deals with well understood application program, team size is reasonably small with experienced team members [$a=2.4$, $a1=1.05$, $b=2.5$, $b1=0.38$]
- **Semidetached:** team consists of a mixture of experienced and inexperienced staff [$a=3.0$, $a1=1.12$, $b=2.5$, $b1=0.35$]
- **Embedded:** if software strongly coupled to complex hardware, or if stringent regulations on operational procedures exist [$a=3.6$, $a1=1.2$, $b=2.5$, $b1=0.32$]

Scheduling

- Identify tasks and subtasks
- Determine dependencies (activity network)
- Allocate resources (Gantt chart)
- Time schedule (PERT charts)

Task Division (Hierarchy)

Activity Dependency (Activity Network)

Critical Path Analysis

- Minimum time (MT) to complete project is the maximum of all paths from start to finish
 - Can be estimated using CPM (Critical Path Method)

Gantt Chart

- A special type of bar chart (named after its developer Henry Gantt) where each bar represents an activity
 - Bar length proportional to duration planned for activity

PERT (Project Evaluation and Review Technique) Chart

- Consists of a network of boxes and arrows
- Boxes represent activities and arrows represent task dependencies
- Boxes usually annotated with pessimistic, likely, and optimistic estimates for every task

SDLCs

- We have seen two (water-fall, ISLC)
- There are others (spiral, iterative, evolutionary ...)
- These are all “traditional” models
 - Stages are mostly the same with variations in execution sequence
 - Equally rigorous with strict requirements at each stage

Problem with Traditional SDLCs

- Rigidity – may lead to time and cost overrun (and even non-acceptance by customer)

Agile Development - Idea

- Agile (fast) development – ensure quick turn-around of projects
 - Eliminate unnecessary things and documentations
 - Start small (don't try to do everything from start)

Agile Process Flow (A-SDLC)

Agile Iteration Workflow

- Typically of 4-6 weeks

How to Make it Work

- Daily meetings (of the development team)
- Live demo – after each iteration
- Feedback – regularly collect from stakeholders/customers and share with team before next sprint
- Remain agile – be open to make changes based on feedback
